

In Google's public GA4 sample, total revenue rose from 13150 to 26966 while sessions fell from 27707 to 27478, and the conversion spike must be verified before acting.

Summary

- This brief uses Google's public obfuscated GA4 sample, not a real client.
- Total revenue changed 105.1% and total transactions changed 58.1%, while total sessions changed -0.8%.
- Total conversion rate changed from 0.82 to 1.36, but the payload flags conversion rate and revenue per session for tracking verification.
- Referral campaign revenue was 16252 with a 175.6% change, while direct campaign revenue was 1033 with a -38.6% change.

This week in numbers

Metric	This week	Previous	Change
Revenue	\$26,966	\$13,150	+105.1%
Transactions	400	253	+58.1%
Sessions	27,478	27,707	-0.8%
Conversion rate	1.36%	0.82%	+66.6%
Average order value	\$67.42	\$51.98	+29.7%
Revenue per session	\$0.98	\$0.47	+106.8%
Engagement rate	93.69%	93.83%	-0.1%

Weekly revenue across the replay. This week in navy.

What changed

Positive Total revenue and transactions

rose. Revenue was 26966 versus 13150, a 105.1% change; transactions were 400 versus 253, a 58.1% change; sessions were 27478 versus 27707, a -0.8% change.

Warning Product view to add to cart weakened. Product view -> add to cart was

18.63 versus 22.45, a -17% change and -3.82 points; the payload lists it as the biggest leak.

Watch Direct traffic and revenue fell. Direct campaign users were 3596 versus

5040, a -28.7% change; direct campaign sessions were 3724 versus 5173, a -28% change; direct campaign revenue was 1033 with a -38.6% change.

Positive Referral campaign performance improved. Referral campaign

revenue was 16252 with a 175.6% change; transactions were 246 with a 110.3% change; conversion rate was 3 with an 87.8% change.

Likely drivers

- The revenue increase is likely consistent with stronger referral campaign performance, because referral campaign revenue was 16252 and changed 175.6%.
- The revenue increase is likely consistent with a higher cart to checkout rate, which rose from 42.15 to 56.62, a 34.3% change.
- The direct traffic decline is likely consistent with direct campaign sessions falling from 5173 to 3724, a -28% change.

Risks if nobody acts

- If the conversion rate and revenue per session spikes are tracking errors, the team may make decisions on inflated performance.
- If product view -> add to cart remains the biggest leak, product interest may not become carts.
- If direct traffic continues to fall, the sample may become more dependent on referral traffic.

Actions

Priority	Action	Owner
High	Verify GA4 purchase, revenue, and conversion tracking before using the conversion rate or revenue per session figures in planning. The payload marks these figures for tracking verification, so they are not a demand story until confirmed. Evidence: revenue_per_session current 0.98 previous 0.47 change_pct 106.8 check_tracking true; conversion_rate current 1.36 previous 0.82 change_pct 66.6 check_tracking true	Analytics & tracking

High	Run one add-to-cart test on top product detail pages, starting with Google Cloud Unisex Zip Hoodie and Google Women's Striped L/S. The funnel shows the biggest leak at product view -> add to cart, and these items have high views and adds to cart. Evidence: Product view -> add to cart current 18.63 previous 22.45 change_pct -17 change_points -3.82; Google Cloud Unisex Zip Hoodie views_cur 3186 adds_to_cart_cur 670; Google Women's Striped L/S views_cur 3267 adds_to_cart_cur 739	E-commerce & CRO
Medium	Create a reactivation test for at-risk high value customers. The at-risk high value segment grew and has high historical spend, so a targeted CRM test can check whether it can be recovered. Evidence: at_risk_high_value customers 470 previous 272 change 198; revenue_to_date 96564; avg_recency_days 62.6	CRM & retention

Data caveats

- Revenue per session and conversion rate have check_tracking true, so both figures must be verified before acting.
- Source breakdowns should be treated with caution because 24.4% of sessions rows are unknown or obfuscated.
- Calendar events are empty, so seasonality cannot be explained from the payload.
- The data is Google's public obfuscated GA4 sample, not a real client.
- Session-level source is available for 73.5% of sessions; the rest use the user's first-touch source.

How this brief was made

Every number was calculated in SQL and Python from GA4 event data. The written analysis was produced by qwen/qwen3.8-27b:free and checked by the number validator: 67 numbers checked, none invented, passed on attempt 3. Source: bigquery-public-data.ga4_obfuscated_sample_ecommerce. Public obfuscated GA4 sample (Google Merchandise Store). Architecture demonstration.
